

river network

water flows downstream

as a static descriptor

basin i 's fixed position
(depth, #upstream, area)

$\Delta\text{NSE} \approx 0$

(+0.006, n.s.)

same network, opposite outcomes

as a dynamic signal

discharge $u_i(t)$ arriving
from upstream, each day

$\Delta\text{NSE} = +0.035$

($p=2.6 \times 10^{-17}$)
